PERMISSION TO USE

In presenting this thesis in partial fulfilment of the requirements for a postgraduate degree from University Utara Malaysia, I agree that the University Library may make it freely available for inspection. I further agree that permission for copying of this thesis in any manner, in whole or in part, for scholarly purposes may be granted by my supervisor in his absence, by the Dean of the Faculty of Information Technology. It is understood that any copying or publication or use of this thesis or parts thereof for financial gain should not be allowed without my written permission. It is also understood that due recognition shall be given to me and to University Utara Malaysia for any scholarly use which may be made of any material from my thesis.

Requests for permission to copy or to make other use of materials in this thesis, in whole or in part, should be addressed to

**Dean of Faculty of Information Technology

Kedah Darul Aman**

ABSTRACT

Timetables are used to schedule classes and teachers in school. It involved assigning times and places to appropriate events by making use of available resource. Badly designed timetables are not just inconvenient but proved expensive in terms of wasting time and money. Hence, the major aim of this research is to investigate the internal mechanism of genetic algorithm in solving and improving class timetabling problem. We have targeted the research on class timetabling problem. Hence, Genetic Algorithm (GA) is used as one of the most popular optimization solutions. It has been implemented in various applications such as scheduling. The flows of GA are using selection, crossover and mutation operators applied to populations of chromosomes. This paper reports the powerful techniques using GA in scheduling. Class timetabling problem is one of the applications in scheduling. In one aspect, it deals with subjects such that it fulfils the process time slot. These aspects are important for the class timetabling so it can be done in a smooth way and no lecture can sit more than one classroom in a same time slot. The other constraint is the lecture workload should be arranged less than two classes in one day. The class timetabling problem at Sekolah Menengah Kebangsaan Bandar Baru Sintok is introduced and the prototype has been developed using Java language. The prototype suggested several feasible solutions to the user.

ACKNOWLEDGEMENTS

Praise be to Allah, Most Gracious, Most Merciful whose blessing and guidance have helped me through entire project works. My most sincere appreciation goes to my beloved parents, for their patience, prayers and understanding over the entire period of my study.

Firstly, special thanks to my supervisor, Dr. Azman Bin Yasin for helping me and understand all the problems that happened with me last month.

I also what thank my brothers because they stay with me all the time even when they are not her but I know that they want me to be the best.

Finally, to my beloved best friend Munzer for being with me all these years and for helping me in every part of my life, he is my brother from another mother and for my cousin Anmar my best cousin.

Dedicated to, , , , , ,

My Loving Parents

CHAPTER 1

INTRODUCTION

The aim of this paper is to discuss on the project background that mainly involves in class timetabling using Genetic Algorithm (GA). The problem statement, the objective and the significance of the study and scope will be discussed in this section.

1.1 Problem Statement

Nowadays, Schools are using timetables to schedule teachers and classes to fully utilize available resources. This is done by assigning correct times and places to appropriate events. Hence, the timetables must be designed to satisfy all user requirements, or else it would be a waste of time and resources.

Prior to the existence of the general algorithms such as evolutionary algorithm (EA), timetable builders tend to plan school timetable manually or using computer
