PERMISSION TO USE

In presenting this project in partial fulfilment of the requirements for a postgraduate degree from Universiti Utara Malaysia, I agree that the University Library may make it freely available for inspection. I further agree that permission for copying of this project in any manner, in whole or in part, for scholarly purpose may be granted by my supervisor(s) or, in their absence by the Dean of Postgraduate and Research. It is understood that any copying or publication or use of this project or parts thereof for financial gain shall not be allowed without my written permission. It is also understood that due recognition shall be given to me and to Universiti Utara Malaysia for any scholarly use which may be made of any material from my project.

Requests for permission to copy or to make other use of materials in this project, in whole or in part, should be addressed to

Dean of Research and Postgraduate Studies

College of Arts and Sciences

ABSTRACT

This project focused on finding out the perception of Tanzanian higher learning institution's community on open source software adoption. It is an attempt to reduce the current problem of pirated software in use by a number of users who cannot afford purchasing a genuine copy of proprietary software such as Microsoft products. A quantitative research was adopted to test the relationship between independent variables: Top management support, cost saving, compatibility, continuity & flexibility technical support and IS community's perception and dependent variable: Open source software adoption. A questionnaire survey was conducted to collect data from three Tanzanian higher learning institutions. Various factors of open source software adoption including IS community's perception and opportunities of open source software to higher learning institutions was examined in this study. An analysis was performed using the SPSS package to which the subsequent result of the correlations shows significant relationship between all independent variables and dependent variables, multiple regressions was also conducted. Three independent variables: Continuity & flexibility, top management support and cost saving had strong influence to the study while compatibility, technical support and IS community's perception had weak influence. Finally discussion, recommendation and conclusion were made.

ACKNOWLEDGEMENT

In accomplishing this project, there are several people who deserve recognition for their kindly support and encouragement.

First of all I would like to thank God for giving me the strength and health to accomplish this project. Not forgotten my parents Mr. Duncan Oyuke & Ms. Lucy for the support, advice and encouragement they provided to make sure I succeed in this project.

My deepest thanks to my supervisor Prof. Madya Dr. Huda Bt Haji Ibrahim for tireless effort, suggestions, guidance to make this work a success with attention and care.

My deep grateful is to Tanzania Public Service College for the financial support to pursue my program. It is through your support I am writing this project which otherwise I would have not being able to accomplish my studies.

Thanks and appreciation to the helpful people at the Institute of Finance management (IFM), Tanzania Institute of Accountancy (TIA) and the University of Dar es Salaam (UDSM) for their time and support in responding to my questionnaire.

Last but not least, my friends Sijali Madikha, Naima Abdullahi Gure, Boukerraf Muhammed, Anab Omar Gure, Emmanuel Myalla and Morine Osunga for their support and encouragement.

CHAPTER ONE

INTRODUCTION

1 Introduction

Open source software is a computer software that comes with a license that offers users the autonomy to run the program, study, modify and redistribute copies of original or modified program for free as per open source initiative (OSI) conditions (Wheeler, 2005). There have been interests on open source software development since 1998 involving software developers from different locations and different organizations. The developers share codes to develop and refine programs that can be given away or charged little fee depending on the business model of specific software. There are different open source products ranging from operating system such as Linux, desktop applications (Open office), Internet infrastructure (Apache, SendMail) and internet applications (Mailman).

Several studies about open source has been conducted in different places, show the way organizations can benefit from adopting it as an alternative to proprietary commercial software. Many organizations adopt open source software for the purpose of cost reduction apart from the gain in autonomy for code modification offered by the open source community (West and Dedrick, 2008; Fitzgerald, 2004; West and Dedrick, 2004). Linux is one of the most adopted open source product in different organization whether public or private. The success of Linux operating system makes the concept of open source software familiar to many institutions and organizations that deal with activities related to information and
