Abstract

A university course timetabling problem is a combination of optimization problems. The problems are more challenging when a set of events need to be scheduled in the time slot, to be located to the suitable rooms, which is subjected to several sets of hard and soft constraints. All these constraints that exist as regulations within each resource for the event need to be fulfilled in order to achieve the optimum tasks. In addition, the design of course timetables for universities is a very difficult task because it is a non-deterministic polynomial, (NP) hard problem. This problem can be minimized by using a Micro Genetic Algorithm approach. This approach, encodes a chromosome representation as one of the key elements to ensure the infeasible individual chromosome produced is minimized. Thus, this study proposes an encoding chromosome representation using one-dimensional arrays to improve the Micro Genetic algorithm approach to soft constraint problems in the university course schedule. The research contribution of this study is in developing effective and feasible timetabling software using Micro Genetic Algorithm approach in order to minimize the production of an infeasible individual chromosome compared to the existing optimization algorithm for university course timetabling where UNITAR International University have been used as a data sample. The Micro Genetic Algorithm proposed has been tested in a test comparison with the Standard Genetic algorithm and the Guided Search Genetic algorithm as a benchmark. The results showed that the proposed algorithm is able to generate a minimum number of an infeasible individual chromosome. The result from the experiment also demonstrated that the Micro Genetic Algorithm is capable to produce the best course schedule to the UNITAR International University.

Acknowledgements

I would like to express my appreciation and thank to my supervisor, Prof. Madya Dr. Azman bin Yasin for being a good advisor in providing assistance, guidelines and support throughout this thesis. I also would like to thank to Dr. Yuhanis bt Yusof for her encouragement and insightful comments. A special thank to my wife Hartini Mohd Ashikin and my mother Aloha Mohd Diah for their understanding, prayers and blessing.

In addition, thanks to my friends:

Roshidi bin Din

Hanizan Shaker bin Hussain

Baharudin bin Osman

For your helps, ideas and support to complete this thesis.

Finally to the people who are keen to knowledge, perhaps this thesis contributes to the body of knowledge and enriches the information hereto.

CHAPTER 1

INTRODUCTION

In general, a university course timetabling problem usually refers to finding the exact allocated time within a limited time period for example a week, for a number of events (courses-lectures) and assignment of events to a number of resources (lecturers-rooms) in such a way that a number of constraints are satisfied.

Yang and Petrovic (2004) has defined the timetabling as the allocation of a set of subject into a classroom over a limited number of time periods to avoid the occurrence of conflicts of interests between two subjects or lecturers. A good scheduling technique that can lead to optimization is important to ensure it is able to produce all timetable for students and lecturers.

The main problem in the university timetable generation is to provide lecturers and lecture activities by matching all lectures involving the consumption a lot of time as well as the person responsible. The information required for the course schedule including room availability, time slots and several specific policy options. For example, information on room availability can be specified to the room capacity for certain events. In the domain of university timetable, it is often used to refer to the construction of schedule (with time slots) through the system by considering several numbers of constraints.
