PERMISSION TO USE

In presenting this research in partial fulfillment of the requirements for a postgraduate degree from Universiti Utara Malaysia, I agree that the library of the University, Perpustakaan Sultanah Bahiyah, may make it freely available for inspection. I further agree that permission for copying this research paper in any manner, in whole or in part, for scholarly purposes may be granted by my supervisor or the Dean, Research and Graduate Studies, Othman Yeop Abdullah Graduate School, University Utara Malaysia. It is understood that any copying or publication or use of this research paper or parts thereof for financial gain shall not be allowed without written permission. It is also understood that due recognition shall be to me and to Universiti Utara Malaysia for any scholarly use which may be made of any material from my research paper.

Request for permission to copy or to make use of materials in this research paper, in whole or in part should be addressed to:

ABSTRACT

The role of foreign direct investment (FDI) and exports continues to be debated and tested in the literature on international economics and development economies. This paper extends the previous empirical studies on the issue by providing some evidence from time-series data period over 1980-2010 of People’s Republic of China. In this study, the dependent variables were economic growth. The model tested using unit root test, Granger causality, Vector Autoregressive (VAR) and Impulse Response Function (IRF) to analysis that dynamic relationship between economic growth, FDI, export and import. In terms of causality the result shows economic growth will provide a positive influence on the level of FDI, that is, economic growth (GDP) granger causes on Foreign Direct Investment (FDI), and there is a mutual influence between export and import because of intra-trade and imports of intermediate goods. The Vector Autoregressive (VAR) and Impulse Response Function (IRF) approach is to investigate the response of the system to economic shocks; the results showed that, the country’s economic growth is influenced by its lagged values of GDP. Finally this paper draws some policy implications for the further studies to focus on the economic growth in China, to ensure that economic growth would not be drop.
ABSTRAK

ACKNOWLEDGEMENTS

It is hard to successfully complete a research without the support of others. I would like to take this chance to express my deep and sincere gratitude to my supervisor, Dr. Lim Hock Eam for his kind encouragement and time while this paper was in process. He provided me with invaluable guidance and continuous advice on my studies.

I owe my loving thanks to my family especially my father Ahniyaz and my mother Arzigul, for their understanding, encouragement and financial supports, which has enabled me to successfully complete my postgraduate study in UUM. Not forgetting, special thanks to my sisters, who always give me support to finishing my master’s program. Without their encouragement and understanding it would have been impossible for me to complete this work.

Finally, thousand thanks to Prof. Dr. Ahmad Sobri Jaafar, Dr. Mukaramah, Mr. Sheyih and all my unforgettable friends for helping me to complete this project. Their assistance really means a lot to me. Also special thanks to the all lectures and members of the University Utara Malaysia for their information, help and guidance. Last but not least, I would like to thank everyone involved who has given inspirations and guidance whether directly or indirectly during my study. Thank you.

CHAPTER ONE

INTRODUCTION

1.1 Background

Trade openness plays an importance role in economic growth in many countries. International trade in the nineteenth century and early twentieth century, generally encouraged the growth of the development countries of today, and it often been referred to as the “engine of growth”. The growth of domestic demand, rapid expansion of trade, particularly in the export sector, led to the creation of large-scale industry to provide a further stimulus.

Openness in trade refers to the degrees to which countries or economies permit or have trade with other countries or economies. The trading activities include export and import, foreign direct investment (FDI), borrowing and lending, and repatriation of funds abroad. Open economies generally have greater market opportunities, at the same time they also face greater competition from foreign businesses. In terms of financial development international trade enables a channel to obtain funds from other countries, and also invest its surplus funds in other countries.

International and domestic trade across Chinese provinces appears to be high and rising even as China has become more integrated with the global economy (Young, 2000; Poncet, 2003). China’s rapid GDP growth in recent decades has been impressive, averaging 10.3% per year from 1978 to 2010. Since 1978, the adoption of “reform and opening” policy initiated by Deng
