PERMISSION TO USE

In presenting this thesis in fulfillment of the requirements for the postgraduate degree from the Universiti Utara Malaysia, I agree that the Universiti Library may take it freely available for inspection. I further agree that the permission for copying of this thesis in any manner, in whole or in part, for scholarly purpose may be granted by my supervisor or, in his absence, by the Dean of the College of Art and Science. It is understood that any copy or publication or use of this thesis or parts thereof for financial gain shall not be allowed without my written permission. It is also understood that due recognition shall be given to me and to the Universiti Utara Malaysia for any scholarly use which may be made of any material from my thesis.

Request for permission to copy or make other use of material in this thesis in whole or in part should be addressed to:

**Dean (Research and Post Graduate)
Universiti Utara Malaysia
06010 UUM Sintok
Kedah Darul Aman
Malaysia**

ABSTRACT

This study was to find out the limitation of existing system in accessing student's results, find out new user requirements and measure the system usability. The respondents are all UUM students as they have experience in using the existing UUM application for checking academic result and they are also potential users of using this system. This study found that the system is acceptable and usable.

Keywords: Mobile Phone Application

ACKNOWLEDGMENT

Praise and gratitude be given to Allah the Almighty for putting forward me such a great strength, patience, courage, and ability to complete this project.

My excessive gratefulness to my supportive and helpful supervisor, Dr.KANG ENG THYE for assessing and guiding me in the completion of the research. With all truthfulness, without his, the project would not have been a complete one. He has really been for me a center of motivation and guidance. I am truly grateful to his continual support and cooperation, as being prepared to assist me all along the completion of the project.

I would like to present my thanks to all of my family, my father, to my dear mother, to all my siblings.

My demonstrative appreciations to all my friends and everyone who has helped either directly or indirectly to the completion of this project.

CHAPTER 1

INTRODUCTION

1.1 Background of the Study

Wireless technology has developed into one of today's hottest topics due to its ability to bring the power of communication and the Internet into the hands of users while overcoming temporal and spatial constraints (Elliott and Phillips, 2004). As the popularity of wireless services grows, manufacturers are enabling wireless devices with an increasing array of features and capabilities. However, a new "buzzword" increasingly being mentioned in the market place is the Wireless Application Protocol (WAP).

The WAP is a completely new concept which provides data oriented services to the mass market and is capable of being beneficial to far more end users than the personal computer (Foo, et al., 2001). For example, many personal digital assistants (PDAs) now operate as cell phones and vice versa. The WAP is also envisioned to be a Web in the pocket. As the benefits of the WAP are recognized and become more widely used, the impact it has on everyday lifestyle is obvious. The WAP brings with it the convenience of distributing information efficiently regardless of geographical boundaries and time.

The system helps the College of Art and Science students to check their academic results and related course information, view their own personal information, check for

CHAPTER 7

CONCLUSION

7.1 Conclusion

The main purpose of this project is to develop a mobile based application for accessing student's academic results in UUM in which has been achieved. At the same time, the prototype has been used to evaluate, the system usability in which has been accomplished through this three and the half month of project duration. The development of the project is based on the SDLC in Object-Oriented approaches and takes UML as the modeling system while the development of the system uses WAPTOR and mobile explorer language. Due to the time constraint, this project does not fully complete its functionality as shown in the prototype. Therefore, it is recommended that future research to be carried out in order to enhance and expand the service of the application by taking this prototype as a starting point of the development.
