Abstract

Electroencephalogram (EEG) based emotion recognition has received considerable attention as it is a non-invasive method of acquiring physiological signals from the brain and it could directly reflect emotional states. However, the challenging issues regarding EEG-based emotional state recognition is that it requires well-designed methods and algorithms to extract necessary features from the complex, chaotic, and multichannel EEG signal in order to achieve optimum classification performance. The aim of this study is to discover the feature extraction method and the combination of electrode channels that optimally implements EEG-based valence-arousal emotion recognition. Based on this, two emotion recognition experiments were performed to classify human emotional states into high/low valence or high/low arousal. The first experiment was aimed to evaluate the performance of Discrete Wavelet Packet Transform (DWPT) as a feature extraction method. The second experiment was aimed at identifying the combination of electrode channels that optimally recognize emotions based on the valence-arousal model in EEG emotion recognition. In order to evaluate the results of this study, a benchmark EEG dataset was used to implement the emotion classification. In the first experiment, the entropy features of the theta, alpha, beta, and gamma bands through the 10 EEG channels Fp1, Fp2, F3, F4, T7, T8, P3, P4, O1, and O2 were extracted using DWPT and Radial Basis Function-Support Vector Machine (RBF-SVM) was used as the classifier. In the second experiment, the classification experiments were repeated using the 4 EEG frontal channels Fp1, Fp2, F3, and F4. The result of the first experiment showed that entropy features extracted using DWPT are better than bandpower features. While the result of the second classification experiment shows that the combination of the 4 frontal channels is more significant than the combination of the 10 channels.

**Keywords:** Discrete wavelet packet transform, Electroencephalogram, Emotion recognition, Entropy, Radial basis function, Support vector machine.
Acknowledgement

All praise is due to Allah, who by His grace I completed this task. May His peace and blessing be upon His prophet, Muhammad (S.A.W.).

Special thanks to my Mother and Father for their love and guidance. I also thank my dear wife for her love, passion and understanding throughout my studies. I wish to also thank my brothers and sisters for caring about me during times of ease and hardship. I will like to show gratitude to my supervisor Dr. Farzana Kabir Ahmad for her guidance and patience during this research work. I will also like to extend my gratitude to Associate Professor Fadzilah Siraj, Dr. Nooraini Yusoff, Dr. Husniza Husni, and Dr. Azizi Bin Ab Aziz, I have gained a lot from them all that have contributed to the success of this work.

Thank you all may Allah help you too.

CHAPTER ONE
INTRODUCTION

1.1 Introduction

Human beings express various emotions during daily activities and interactions with other people. In human daily interactions, these emotions are recognized through facial expression, voice, or body gesture. The task of recognizing emotions is simple for human, however computers capability of recognizing human emotions is still diminished (Amaral, Ferreira, Aquino, and Castro (2013).

In affective computing, facial expressions, body gestures, and vocal intonation have been used to recognize human emotions (Fu, Yang, and Hou, 2011). However, due to the fact that human can control the facial expressions, body gestures, and vocal intonation voluntarily, various studies have used physiological bio-signals from the peripherals of the human body to recognize emotions (Kim, Bang, and Kim, 2004; Kim and André, 2006; Kim and André, 2008; Picard, Vyzas, and Healey, 2001). The electrical signals from the brain itself acquired by Electroencephalograms (EEG) are recently used to recognize human emotions (Jatupaiboon, Pan-ngum, and Israsena, 2013; Lin, Wang, Jung, Wu, Jeng, Duann and Chen, 2010; Wang, Nie, and Lu, 2011).

The non-linearity, non-stationary, and chaotic properties of the EEG signals have created great problems that lead to thorough signal processing and analysis (Sanei and Chambers, 2008). In other words, to achieve optimal results, there is a need to systematically choose the methods and techniques that will be applied when
