Data: 10th December 2015
PERMISSION TO USE

In presenting this thesis in fulfillment of the requirements for a postgraduate degree from Universiti Utara Malaysia, I agree that the Universiti Library may make it freely available for inspection. I further agree that permission for the copying of this thesis in any manner, in whole or in part, for scholarly purpose may be granted by my supervisor(s) or, in their absence, by the Dean of Othman Yeop Abdullah Graduate school of Business. It is understood that any copying or publication or use of this thesis or parts thereof for financial gain shall not be allowed without my written permission. It is also understood that due recognition shall be given to me and to Universiti Utara Malaysia for any scholarly use which may be made of any material from my thesis.

Requests for permission to copy or to make other use of materials in this thesis, in whole or in part should be addressed to:

Dean of Othman Yeop Abdullah Graduate School of Business
UUM College of Business

ABSTRACT

This study attempts to investigate the possible relationship between stock price and inflation rate in China over the period of September 1997 to July 2015 using variables of share price index, consumer price index (CPI), interest rate and industrial production. Past studies mainly focus on the developed countries. Despite numerous theories, literature reveals that there is not enough information and investigation about developing countries especially China. This study aims to narrow this gap by examining the relationship between stock and inflation in China. The Vector Error Correction Model (VECM) has been employed to determine the long and short run relationships among the variables respectively. The cointegration test reveals a significant long run relationship between the underlying variables. Based on the VECM results, inflation is found to have a significant and positive influence on the stock market in the long run as well as in the short run. The Granger causality test also indicates that inflation has a unidirectional causality on the stock market index. In general, the results suggest a positive significant relationship between inflation and stock price.
ACKNOWLEDGEMENT

First of all, I would like to express my gratitude to my supervisor, Dr. Sabariah bt Nordin, for her continuous support, guidance, and advice all the way through this work. Without her support, the result would not be so nice. In addition, I would like to thank the staffs of the School of Economics, Finance and Banking, the Othman Yeop Abdullah Graduate School of Business and the Sultanah Bahiyah Library for their time in helping me to complete my thesis. Last but not least, I would also like to convey my special thanks to my family and friends for giving me endless support and encouragement.

CHAPTER 1
INTRODUCTION

1.1 Background of the Study

Financial economists are always keen about the relationship between stock price and inflation. These financial economists have the feelings that equity can be used to hedge against the inflation. Even though there are numerous studies on stocks and pricing model, investigations on the relationship between stock prices and inflation in emerging countries are still limited. Furthermore, the inconclusiveness of empirical results across developing countries regarding the relationship between stock prices and inflation creates a gap to be studied.

Inflation and stock prices are two crucial indicators of a country’s economy. In 1970s, because of the high inflation, western economists begin to examine the relationship between stock prices and inflation (Nelson, 2005). The impact of inflation on the stock market provides an important implication for risk management practices, financial securities valuation and government policy towards financial market. Inflation causes the redistribution of wealth. For the rational investors, there is a risk-return trade-off that they need to consider. At the same time, they need to evaluate whether the rate of return in the stock investments can compensate the loss of purchasing power as a result of inflation. In this study, we seek evidences of correlation and relationship between inflation, stock prices, industrial production and interest rate and mainly investigate the impact of inflation on stock prices through the time series data. Results of this study can benefit not just the shareholders but also the policy makers.

Earlier researches have been focusing on the Fisher Effect Theory (Fisher, 1965). According to
