## Abstrak

Topologi merupakan salah satu bidang tumpuan matematik. Kebelakangan ini, topologi menjadi komponen penting matematik kerana pelbagai kegunaannya dalam memahami masalah kehidupan sebenar. Konsep asas ruang topologi  $(X, \tau)$  berkait rapat dengan set terbuka. Operasi pada  $\tau$  telah dikaji oleh ramai penyelidik. Antara operasi yang telah dikaji ialah terbuka- $\gamma$ , pra-terbuka- $\gamma$ , semi-terbuka- $\gamma$ , terbuka- $\gamma$ - $b$ , terbuka- $\gamma$ - $\beta$  dan terbuka- $\alpha$ - $\gamma$ . Walau bagaimanapun, pentakrifan kelas set baharu operasi  $\gamma$  pada topologi  $\tau$  dengan menggabungkan operasi sedia ada belum pernah diteroka. Sehubungan itu, kajian ini bertujuan mentakrif beberapa kelas set baharu, membina kelas fungsi baharu serta memperkenalkan jenis aksiom pemisahan dan ruang pemisahan baharu berasaskan set terbuka- $\gamma$ . Kelas baharu yang terbina ialah set sekata-terbuka- $\gamma$  dan terbuka- $\gamma$ - $P_S$ . Set peluaran- $\tau_\gamma$ - $P_S$ , pedalaman- $\tau_\gamma$ - $P_S$ , terbitan- $\tau_\gamma$ - $P_S$  dan sempadan- $\tau_\gamma$ - $P_S$  turut terbentuk hasil dari takrifan set terbuka- $\gamma$ - $P_S$  dan pelengkapnya. Set terbuka- $\gamma$ - $P_S$  dan pedalaman- $\tau_\gamma$ - $P_S$  seterusnya digunakan untuk mentakrif kelas set baharu bagi set terbuka- $\gamma$ - $P_S$  yang dinamakan set tertutup teritlak- $\gamma$ - $P_S$ . Seterusnya, beberapa kelas fungsi baharu yang dikenali sebagai selanjar- $\gamma$ - $P_S$ , selanjar- $(\gamma, \beta)$ - $P_S$  dan tak terlerai- $(\gamma, \beta)$ - $P_S$  yang berasaskan set terbuka- $\gamma$ - $P_S$  diperkenalkan. Selanjutnya, beberapa jenis fungsi- $\gamma$ - $P_S$  yang lain seperti terbuka- $\beta$ - $P_S$  dan terbuka- $(\gamma, \beta)$ - $P_S$  dibina. Di samping itu, beberapa kelas aksiom pemisahan- $\gamma$ - $P_S$  baharu diperkenalkan dengan menggunakan set terbuka- $\gamma$ - $P_S$  dan pelengkapnya serta set tertutup teritlak- $\gamma$ - $P_S$ . Perhubungan dan sifat bagi setiap kelas set, fungsi- $\gamma$ - $P_S$  dan aksiom pemisahan- $\gamma$ - $P_S$  turut terbentuk. Kesimpulannya, kajian ini telah berjaya mentakrif beberapa kelas set baharu dengan menggunakan operasi  $\gamma$  pada topologi  $\tau$ .

**Kata kunci:** Set terbuka sekata- $\gamma$ , set - $\gamma$ - $P_S$ , fungsi - $\gamma$ - $P_S$ , aksiom pemisahan - $\gamma$ - $P_S$ , ruang- $\gamma$ .

## Abstract

Topology is one of the focus areas in mathematics. Recently, topology has become an important component in applied mathematics due to its vast applications in understanding real life problems. The basic concept of topological space  $(X, \tau)$  deals with open sets. Operations on  $\tau$  have been investigated by numerous researchers. Among these operations are  $\gamma$ -open,  $\gamma$ -preopen,  $\gamma$ -semiopen,  $\gamma$ - $b$ -open,  $\gamma$ - $\beta$ -open and  $\alpha$ - $\gamma$ -open which involve  $\tau_\gamma$ - $P_S$ -interior and  $\tau_\gamma$ - $P_S$ -closure. However, no one has attempted to define new class of set using operation  $\gamma$  on the topology  $\tau$  by combining the existing operations. This study, therefore, aims to define new classes of sets, construct new classes of functions, and introduce new types of separation axioms and spaces using the concept of  $\gamma$ -open sets. The new classes developed are  $\gamma$ -regular-open and  $\gamma$ - $P_S$ -open sets. By applying  $\gamma$ - $P_S$ -open sets and their complements, the notions of  $\tau_\gamma$ - $P_S$ -closure,  $\tau_\gamma$ - $P_S$ -interior,  $\tau_\gamma$ - $P_S$ -derived set and  $\tau_\gamma$ - $P_S$ -boundary of a set are established. The notions of  $\gamma$ - $P_S$ -open and  $\tau_\gamma$ - $P_S$ -closure sets are then used to define a new class of  $\gamma$ - $P_S$ -open sets called  $\gamma$ - $P_S$ -generalised closed sets. Moreover, several new classes of functions called  $\gamma$ - $P_S$ -continuous,  $(\gamma, \beta)$ - $P_S$ -continuous and  $(\gamma, \beta)$ - $P_S$ -irresolute functions in term of  $\gamma$ - $P_S$ -open sets are introduced. Furthermore, other types of  $\gamma$ - $P_S$ -functions such as  $\beta$ - $P_S$ -open and  $(\gamma, \beta)$ - $P_S$ -open are constructed. In addition, some new classes of  $\gamma$ - $P_S$ -separation axioms are established by using  $\gamma$ - $P_S$ -open and its complement as well as  $\gamma$ - $P_S$ -generalised closed sets. The relationships and properties of each class of sets,  $\gamma$ - $P_S$ -functions and  $\gamma$ - $P_S$ -separation axioms are also established. In conclusion, this study has succeeded in defining new classes of sets using operation  $\gamma$  on the topology  $\tau$ .

**Keywords:**  $\gamma$ -regular-open set,  $\gamma$ - $P_S$ -sets,  $\gamma$ - $P_S$ -functions,  $\gamma$ - $P_S$ -separation axioms,  $\gamma$ -spaces.

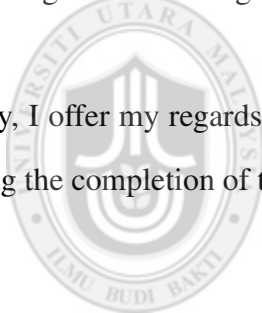

## Acknowledgement

In the Name of Allah, the Most Gracious and the Most Merciful

First and foremost, I must sincerely thank my mother who has supported me in her prayers to God to protect and guide me in the right way. I would also like to take this opportunity to express my deepest gratitude to all my family members and friends. This dissertation would have not been possible without them.

I heartily thank my two supervisors, Dr. Nazihah Ahmad and Prof. Dr. Zurni Omar, for all their support and guidance during the past three years. Without their incredible knowledge and encouragement, this dissertation would have not been completed.

Lastly, I offer my regards and blessings to all of those who supported me in any respect during the completion of the dissertation.

# CHAPTER ONE

## INTRODUCTION

### 1.1 Introduction

Topology is one of the major areas in mathematics. Recently, topology has become an important component of applied mathematics as many mathematicians and scientists employing concepts of topology to model and understand real-world structures and phenomena. The term topology, literally, means the study of position or location. In other words, topology is the study of shapes, including their properties, deformations applied to them, mappings between them, and configurations composed of them. The definition of a topology that used throughout this study is stated as follows.

**Definition 1.1.1.** (see Steen and Seebach, 1978) Let  $X$  be a nonempty set. A class  $\tau$  of subsets of  $X$  is a topology on  $X$  if  $\tau$  satisfies the following three conditions:

1. The empty set  $\phi$  and the whole set  $X$  belong to  $\tau$ .
2. The union of any finite or infinite number of sets in  $\tau$  belongs to  $\tau$ .
3. The intersection of any two (finite) number of sets in  $\tau$  belongs to  $\tau$ .

Members of  $\tau$  are often called as open sets and the pair  $(X, \tau)$  is called a topological space. A subset  $A$  of a topological space  $(X, \tau)$  is closed if its complement is open. The closure of  $A$  is the intersection of all closed sets of  $X$  containing  $A$ . The interior of  $A$
