## PERMISSION TO USE

In presenting this dissertation/project paper in partial fulfillment of the requirements for a Post Graduate degree from the Universiti Utara Malaysia (UUM), I agree that the Library of this university may make it freely available for inspection. I further agree that permission for copying this dissertation/project paper in any manner, in whole or in part, for scholarly purposes may be granted by my supervisor(s) or in their absence, by the Dean of School of Economics, Finance & Banking where I did my dissertation/project paper. It is understood that any copying or publication or use of this dissertation/project paper parts of it for financial gain shall not be allowed without my written permission. It is also understood that due recognition shall be given to me and to the UUM in any scholarly use which may be made of any material in my dissertation/project paper. Request for permission to copy or to make other use of materials in this dissertation/project paper in whole or in part should be addressed to:

Dean of School of Economics, Finance & Banking

Universiti Utara Malaysia

## ABSTRACT

This study investigates the impact of CEO power on business risk-taking in a sample of 362 publicly traded companies in Malaysia, and the results are promising. Using a simultaneous equations method, our primary findings suggest that the proportion of independent directors on the board, the size of the board, and the authority and remuneration of the CEO all had a negative impact on bank risk-taking. Firm risk-taking was affected positively by institutional shareholder ownership and the presence of duality, rather than negatively by these factors. We also independently examine and notice that, in the firm, primarily board independence and institutional ownership have the same influence on risk as they did previously. We reach the conclusion that different governance features have varying degrees of importance for CEOs' risk-taking, which is dependent on the economic climate. The research is carried out utilizing the risk variable, with corporate size, size of the board of directors, independence managers, CEO, CEO and CEO as independent factors. Descriptive statistics are used to compile a data package that reflects a population or a sample by understanding the short descriptive coefficients. The correlation analysis should be conducted to identify the strength and direction of the linear connection of the structure. The study does panel regression with a pool of ordinary smaller square (OLS) and a specification of a fixed effect. In this work, the VIF addressed the multicollinearity problem between independent variables.

## ACKNOWLEDGEMENT

I would like to extend my deepest gratitude and thanks to God for giving me excellent health, energy, and capability to complete my thesis.

First in place, I would like to thank to my very friendly lecturer, Dr. Ooi Chai Aun for his great wisdom and expertise, endless support, useful suggestions, guidance, and enthusiasm throughout the duration of my knowledge acquisition study in thesis work. Your professional and supervising skills will always be remembered by me and I have really enjoyed.

To my Mother, Kanamah Amirthalingam & Late Father, Devarajan Raman for their constant prayers, continuous love, and support since the day I was born, thanks for raising and teaching me so well. This credit also goes to the rest of my family.

I also wish to thank my friends and other lecturers in Universiti Utara Malaysia. Without their endless assistance, attention, care, encouragement, and sacrifice, it would have been hard for me to complete this study.

Finally, I wish to thank all individuals and institutions that have directly or indirectly contributed toward the completion of my Master dissertation.

Many thanks to these good people and may God bless you all.

## CHAPTER ONE

### INTRODUCTION

#### 1.1 Background of Study

As widely reported, many publications in the business press concentrate on talks about prominent CEOs and their bold commercial decisions. In the executive effects' literature, researchers have studied this problem through the use of the upper echelon research tradition. The debate in this realm especially examines whether there is a connection between CEO authority and organizational success. While there have been research demonstrating a link between CEO authority and a corporation's decision to combine or acquire, more recent studies have shown that CEOs have substantial influence on business strategy including mergers and acquisitions. At this point, there is empirical evidence to support the claims that both the strategy selected by a company and its level of success are affected by the amount of authority the CEO has. Despite growing evidence that CEOs' influence on business performance and strategic decision-making is significant, there is less clarity about their involvement in driving the innovation agenda. There is substantial research demonstrating a relationship between powerful CEOs and the choosing of business strategies, but it remains unclear if powerful CEOs directly impact organizational innovation activities. Chief executives' position in the high echelons and influence in strategic choices are key factors to consider while evaluating the function of CEOs.

Additionally, while other high-level managers and board members play a part in the process of making strategic decisions, CEOs are required to keep themselves involved in the process of developing strategies. Higher level executives typically find themselves under intense pressure to be the primary designers of the firm's strategy. Today, the present climate of change,
