PERAKUAN KERJA TESIS / DISERTASI
(Certification of thesis / dissertation)

Kami, yang bertandatangan, memperakukan bahawa
(We, the undersigned, certify that)

SHAHBAZ NAWAZ

calon untuk Ijazah
(candidate for the degree of)

PhD

telah mengemukakan tesis / disertasi yang bertajuk:
(has presented his/her thesis / dissertation of the following title):

"MODIFICATION OF DAL DISTRIBUTION: A COMPARATIVE ANALYSIS OF BURR XII-DAL AND WEIBULL-DAL DISTRIBUTIONS"

seperti yang tercatat di muka surat tajuk dan kulit tesis / disertasi.
(as it appears on the title page and front cover of the thesis / dissertation).

Bahawa tesis/disertasi tersebut boleh diterima dari segi bentuk serta kandungan dan meliputi bidang ilmu dengan memuaskan, sebagaimana yang ditunjukkan oleh calon dalam ujian lisan yang diadakan pada : **11 September 2023.**

That the said thesis/dissertation is acceptable in form and content and displays a satisfactory knowledge of the field of study as demonstrated by the candidate through an oral examination held on: **11 September 2023.**

Permission to Use

In presenting this thesis in fulfillment of the requirements for a postgraduate degree from Universiti Utara Malaysia, I agree that the Universiti Library may take it freely available for inspection. I further agree that permission for the copying of this thesis in any manner, in whole or in part, for the scholarly purpose may be granted by my supervisor(s) or, in their absence, by the Dean of Awang Had Salleh Graduate School of Arts and Sciences. It is understood that any copying or publication or use of this thesis or parts thereof for financial gain shall not be allowed without my written permission. It is also understood that due recognition shall be given to me and to Universiti Utara Malaysia for any scholarly use which may be made of any material from my thesis.

Requests for permission to copy or to make other use of materials in this thesis, in whole or in part, should be addressed to:

Dean of Awang Had Salleh Graduate School of Arts and Science

UUM College of Arts and Sciences

Universiti Utara Malaysia

Abstrak

Taburan klasik seperti taburan Burr-G dan Weibull-G yang mempunyai kurang dari empat parameter kebiasaanya digunakan untuk mewakili data hayat, tidak memadai untuk menerangkan cerapan sebenar dengan tepat. Taburan ini sering mengalami kesukaran untuk mengenalpasti kerumitan dan gangguan yang terdapat dalam data, yang membawa kepada ketidaktepatan dalam pemodelan dan analisis. Justeru itu, kajian ini memperkenalkan dua model hayat baharu berdasarkan taburan yang dinyatakan sebelum ini untuk menangani isu tersebut. Model yang dinamakan sebagai BurrXII-DAL dan Weibull-DAL, adalah berasaskan sifat taburan DAL, dan mempunyai lima parameter. Analisis statistik dijalankan ke atas model ini, termasuk pemeriksaan terhadap sifat kebolehpercayaan dan pengembangan ketumpatan. Momen biasa dan tidak lengkap, fungsi penjanaan momen, fungsi kuantil, momen berwajaran kebarangkalian, statistik aturan dan entropi Renyi diterbitkan secara eksplisit. Kaedah kebolehjadian maksimum digunakan untuk menghasilkan anggaran bagi parameter untuk model menggunakan kaedah *Broyden-Fletcher-Goldfrab-Shanno* berulang yang terdapat dalam pakej R. Seterusnya, lima set data sebenar digunakan untuk memperlihatkan keupayaan model BurrXII-DAL dan Weibull-DAL. Pelbagai kriteria kebagusan penyuaian, termasuk AIC, BIC, A^* , W^* dan nilai- p (KS) digunakan. Kedua-dua model, taburan BurrXII-DAL dan Weibull-DAL berprestasi lebih baik kerana ia mempunyai penyuaian fleksibel dengan data sebenar berbanding model kompetitif yang lain. Model tersebut terbukti berkesan kerana ramalan kadar kegagalan adalah lebih tepat dan fungsi kadar bahaya menunjukkan fleksibiliti dengan senario yang rumit. Taburan BurrXII-DAL dan Weibull-DAL dengan lima parameter telah berjaya dibangunkan dalam kajian ini. Kajian ini telah memberikan pandangan yang mendalam mengenai kelebihan dan kelemahan setiap taburan serta mengenal pasti situasi di mana satu taburan mungkin lebih sesuai daripada yang lain.

Katakunci: Taburan keluarga Burr-G dan Weibull-G, Taburan DAL, Taburan BurrXII, Taburan Weibull, Anggaran kebolehjadian maksimum.

Abstract

Classical distributions such as Burr-G and Weibull-G distributions with less than four parameters are commonly used to represent lifetime data, frequently prove insufficient in accurately describing real observations. These distributions often struggle to capture the complexities and nuances present in the data, leading to inaccuracies in modeling and analysis. Hence, this study introduces two new lifetime models based on the aforementioned distributions to address these issues. These models, called BurrXII-DAL and Weibull-DAL, are based on the properties of the DAL distribution, and have five parameters. Statistical analyses are conducted on these models, including examining their reliability properties and density expansion. Their ordinary and incomplete moments, moment generating function, quantile function, probability weighted moments, order statistics, and Renyi entropy have all been derived explicitly. Maximum likelihood technique is used to provide estimates for the model's parameter using Iterative Broyden-Fletcher-Goldfrab-Shanno method in the R-package. Then, five actual datasets are used to demonstrate the ability of the BurrXII-DAL and Weibull-DAL models. Various measures of goodness-of-fit, including AIC, BIC, A^* , W^* and p -value (KS) are used. Both models, BurrXII-DAL and Weibull-DAL distributions performed better as they are flexible fit to the real data as compared to the other competitive models. The models are proven effective since the prediction of the failure rate is more accurate and the hazard rate function shows flexibility with complicated scenario. BurrXII-DAL and Weibull-DAL distributions with five parameters are successfully developed in this study. This research has provided insights into the strengths and weaknesses of each distribution and has identified situations where one distribution may be more appropriate than the other.

Keywords: Burr-G and Weibull-G family distributions, DAL distribution, BurrXII-Distribution, Weibull-Distribution, Maximum likelihood estimation.

Acknowledgements

Bismillahirrahmanirrahim.

First and foremost, praise to the Almighty Allah, whom ultimately, we depend on for sustenance and guidance.

My sincere and profound appreciation goes to my supervisor, Associate Professor Dr. Zahayu Binti Md Yusof and Co-Supervisor Dr. Friday Zinzendoff Okwonu both are strong encouragement, guidance, support, and constructive comments during my study. Both were always there for me whenever I needed help or advice.

I am deeply grateful to my family and friends for their unconditional trust, encouragement, and supplications throughout this journey that was the source of my strength and perseverance. Their sacrifices, love and understanding really motivated me to work harder in completing this thesis. May Allah bless them all.

I would like to thank Universiti Utara Malaysia (UUM) for giving me a chance to study in this beautiful green university. My appreciation also goes to the administrative staff in School of Quantitative Sciences and Awang Had Salleh Graduate School, for being helpful and supportive during my study in UUM.

Finally, this PhD dissertation is dedicated to my Parents.

CHAPTER ONE

INTRODUCTION

1.1 Introduction

In our study, we explore the application of probability distributions in reliability analysis, particularly focusing on the Burr XII and DAL and Weibull distributions. These distributions are essential in modeling various real-world scenarios, such as lifetime data analysis and reliability assessment.

The Burr XII distribution is renowned for its flexibility in modeling a wide range of positively skewed data, making it valuable for reliability analysis. Its shape parameter allows it to adapt to various failure rate behaviors over time. Nevertheless, one of the limitations of the Burr XII distribution is its parameter estimation complexity, which can be challenging for small sample sizes. Additionally, it may not always fit well with datasets exhibiting extreme tail behaviors (Smith & Johnson, 2017).

The DAL distribution is an extension of the Weibull distribution, introducing two location parameters, which provide greater flexibility in modeling diverse failure patterns. While this distribution offers significant advantages, such as enhanced model fitting, it can be sensitive to the choice of location parameters and may require more data to estimate accurately. This sensitivity can make parameter estimation more challenging, and the DAL distribution may not always be the best choice for simple failure patterns (Brown, 2008).

The Weibull distribution is a fundamental tool in reliability analysis and is celebrated for its versatility in modeling various failure patterns, such as early-life failures, constant failure rates, and wear-out failures. However, the Weibull distribution may not
