DETECTION METHOD FOR TEXT STEGANALYSIS USING
EVOLUTION ALGORITHM (EA) APPROACH

A project submitted to Dean of Research and Postgraduate Studies Office in partial
Fulfillment of the requirement for the degree
Master of Science (Information Technology)
Universiti Utara Malaysia

By
Puriwat Lertkrai

Permission to Use

In presenting this project in partial fulfillment of the requirements for a postgraduate degree from Universiti Utara Malaysia, I agree that the University Library may make it freely available for inspection. I further agree that permission for copying of this project in any manner, in whole or in part, for scholarly purpose may be granted by my supervisor(s) or, in their absence by the Dean of Postgraduate and Research. It is understood that any copying or publication or use of this project or parts thereof for financial gain shall not be allowed without my written permission. It is also understood that due recognition shall be given to me and to Universiti Utara Malaysia for any scholarly use which may be made of any material from my project.

Requests for permission to copy or to make other use of materials in this project, in whole or in part, should be addressed to

Dean of Research and Postgraduate Studies

Abstract

The ability of sending a secret message through a network nowadays has become a more challenging and complex process. One of the reasons why we need tools to detect the hidden message is because of security and safety. Secret messages can be both for good or bad, and subversive groups have been known to send secret messages to coordinate their terrorist activities. Thus, a technique such as steganalysis is one method example to detect a secret message. Much of the technical steganalysis work had been carried out on image, video, and audio steganalysis, but in any agency or organisation, all business documents generally uses the natural language in text form or document form. Therefore, this research employed a detection factor based on the evolution algorithm method for text steganalysis. The aim of this project was to detect a hidden message in an observed message using text steganalysis.

Acknowledgement

Firstly, I would like to thank to my supervisors, Mr. Roshidi Din and Dr. Shahrul Azmi always have faith in me and give ideas and suggestions to complete this project. I also would like to use this opportunity to thank my evaluators, Dr. Azizi Ab Aziz and Mdm. Nur Azzah Abu Bakar, who had given me the comments for improving my project report. I used what I had learnt in this project.

I am most grateful to my family. I am deeply and forever indebted to the people in my life that touched my heart and gave me the strength to move forward for achieving something better, especially to my beloved father, mother, and my young sister, Mr. Siri, Mrs. Suvapa, Ms. Doungdusade for their love and support.

I would also like to thank to my two best friends in UUM, Sittichai and Jutaporn. Thank for your never ending encouragement to complete this project.

EDSS	Evolution Detector Steganalysis System
QIM	Quantization Index Modulation
MRF	Markov Random Field

CHAPTER ONE

INTRODUCTION

1.1 Introduction

This chapter provides an overview of the entire study. The first section describes the background of the study that leads to the implementation of the whole research. This is followed by problem statement, research questions, objectives, scope of the study, significance of the study, and research organisation. The last section provides the way this research report is summarised.

1.2 Background of the Study

In recent decades, computer development and the expansion to use in different areas of life and work has come to the fore, and one of the many issues that is being raised is security of information which has gained special significance. This is because the information is now being treated as a commodity or a resource comparable to labour and capital (Hillman, 1982). One of the concerns in the area of information security is the concept of information hiding (Shirali-Shahreza and Shirali-Shahreza, 2006). The information hiding concept has received attention from the research community and from industry since before the 1990s and it is changing fast since the first academic conference on the subject organised in 1996. There is a difference between information hiding and encrypting where the goal of information hiding is to avoid intrusion or discovery of hidden data. Meanwhile, the goal of encrypting is to restrict data access.
