PERMISSION TO USE

In presenting this thesis in fulfillment of the requirements for a Master degree from the Universiti Utara Malaysia (UUM), I agree that the Library of this university may make it freely available for inspection. I further agree that permission for copying this thesis in any manner, in whole or in part, for scholarly purposes may be granted by my supervisor or in their absence, by the Dean of Othman Yeop Abdullah Graduate School of Business where I did my thesis. It is understood that any copying or publication or use of this thesis or parts of it for financial gain shall not be allowed without my written permission. It is also understood that due recognition shall be given to me and to the UUM in any scholarly use which may be made of any material in my thesis.

Request for permission to copy or to make other use of materials in this thesis in whole or in part should be addressed to:

ABSTRACT

The objective of this study was to examine whether there is exists a long run relationship between defense expenditure and economic growth, and investigate the plausibility of using defense expenditure as a macroeconomic stabilization tool (referred as Military Keynesianism Hypothesis) in case of Pakistan over the period 1975 – 2010. The Autoregressive Distributed Lag (ARDL) bounds testing approach was used to find out long run relationship between defense expenditure, economic growth, development expenditure, inflation and national saving. The Augmented Dickey-Fuller (ADF) test was used for checking stationarity. The results of ADF test revealed that inflation and saving are stationary at level while defense expenditure, development expenditure and GDP become stationary at first difference. Results of ARDL indicated that data is stable and confirmed the existence of long run relationship. The robustness of the model has been confirmed by diagnostic tests for serial correlation, function form, normality, heteroscedasticity, and structural stability for the model. The selected model generally passes all diagnostic tests and proves the robustness of the selected model. Moreover, results show that defense expenditure has negative impact on economic growth while saving has positive impact on economic growth but other variables have no impact on economic growth. These results for long run negative relationship between defense expenditure and economic growth suggest that in case of Pakistan MKH does not hold over the estimation period. The negative long run relationship between defense expenditure and economic growth implies that the policy makers need to have a greater focus on development spending as compared to defense spending.

Keywords: ARDL, economic growth, defense expenditure, inflation, Pakistan.

ACKNOWLEDEMENT

Challenged by exhausting obstacles, eventually I managed to complete this study at the University Utara Malaysia (UUM). Because of this achievement, I would like to say Alhamdulillah, the highest gratitude to Allah SWT for his continuous blessing and guidance until this thesis is materialized.

During the writing of this thesis, the author continuously had intervened by the riddle and constraints, but God's hand and other fellow's assistance were the truly grant in completing this thesis. For that, the author humbly thanks a sincere gratitude to:

Associate Professor Dr. Nor Aznin Bt Abu Bakar for her guidance and understanding throughout my Master program. Her valuable advices and comments during my study have helped me to finish this thesis and achieve my professional career goal. Special thanks to Associate Professor Dr. Sallahuddin Hassan for his comments and guidance to complete this thesis.

I also wish to acknowledge my indebtedness to my family specially my mother for their fulfilling support and understanding as well as their prayers.

Last but not least, my gratitude also goes to Dr. Azam Khan (Department of Economics, UUM), Mr. Noman Arshad (The University of Edinburgh, UK) and Mr. Haroon Hafeez (PhD Scholar, UUM) for their help throughout my thesis.

CHAPTER ONE

INTRODUCTION

1.1 BACKGROUND OF THE STUDY

The relationship between defense expenditure and economic growth has attracted considerable interest among economists as well as policy makers. The military spending is a global issue during the end of the Second World War which provided a chance for developing as well as developed countries to decrease their military spending. The purpose of increasing defense expenditure is mainly to cooperate with local insecurity and arm race. Moreover, developed countries have focus on the point about possible harmful effects of unfettered military expenditure in developing countries. It was argued that military expenditures may lead to problem of balance of payment deficit, decrease in economic growth, and as a result of it, important social and economic expenditure may be crowded out. Therefore, these concerns have been raised in the past wars in Afghanistan, Iraq, Kashmir, Bosnia, Chechnya, Palestine and collapse of Soviet Union.

The relationship between defense expenditure and economic growth has been highly debating among economist. In general, results of different studies have shown that defense expenditure can affect the economy both positively and negatively [Yildirim *et al.*, 2006; Dakurahet *et al.*, 2000; Kollias *et al.*, 2004]. Previous results were inconsistent and mix; thus defense expenditure can affect economic growth in different ways. Hassan *et al.* (2003) stated that defense expenditure can affect economic growth positively
